LunulaLaser[™]
BY ERCHONIA

**SAFELY TREATS
TOENAIL FUNGUS
IN ONLY FOUR 12-MINUTE
PAINLESS TREATMENTS.**

What is onychomycosis?

Onychomycosis is a fungal infection of the toenails. Dermatophytes are the fungi most commonly responsible for onychomycosis.

It is a very common condition and is estimated to impact at least 10% of the worldwide population. You may suffer from onychomycosis if you have one or more of the following symptoms:

- Thickened nail
- Crumbly or brittle nail
- Nail distorted in shape or separated
- Nail with no luster or shine
- A white, yellow, or brown coloured nail, caused by debris build-up

This embarrassing and unsightly problem facing millions of people has been difficult to treat safely and effectively with oral medications, topical drugs, or hot lasers.

Oral Fungus Medications are linked to side effects and serious long-term health risks, including liver damage and heart failure.

Topical Drugs are often ineffective because they cannot penetrate through the nail to reach the infection.

Hot Laser Treatments are often painful and ineffective because they cannot properly treat the entire nail.

The Solution: Erchonia Lunula™ Laser

The Erchonia Lunula Laser therapy promises clear looking nails with simple, painless treatments so you can enjoy healthy, beautiful feet again.

The Erchonia Lunula Laser is a proven cold low-level laser therapy that:

- Kills toenail fungus in just four painless 12-minute treatments
- Treats onychomycosis with no pain, no recovery time, and no side effects
- Allows clear healthy nails to grow

The Erchonia Lunula Laser kills fungus that lives in and under the toenail. The laser light passes through the nail without causing damage to it or the surrounding skin. Plus, this convenient in-office procedure typically takes minutes to perform, with absolutely no recovery time required!
